

Loading images using stb_image

Overview

stb_image is a public domain, header-only image loading library which is often used for loading images in computer graphics applications. It supports loading several image file formats, including JPG, PNG, TGA, and HDR. It is easy to include in projects since it only consists of a single header file. It can be accessed at the following URL:

https://github.com/nothings/stb/blob/master/stb_image.h

How to use

The program `RayTracer_stb_texture.cpp` demonstrates the usage of `stb_texture.h` to load and display a texture in a simple ray tracer (based on Labs 7 and 8). The program includes the header file `stb_texture.h`, which provides an easy interface to the relevant parts of `stb_image.h`.

To compile and run `RayTracer_stb_texture.cpp`, you will additionally require your files from Labs 7 and 8 (`Ray.cpp`, `Ray.h`, `Sphere.cpp` etc.). The image (`Flowers.jpg`) will need to be in the same folder as the executable. The program generates the following output:
